## 1 Info

### 1.1 Template

```

1  #include <bits/stdc++.h>
2
3  void test(){
4      //read
5      //reset
6  }
7  int main(){
8      //initialize
9      int T;
10     std::cin >> T;
11     while(T-->0) test();
12 }

```

### 1.2 Debug compile options

```
g++ -Wall -Wextra -pedantic -g -std=c++11 -O2 -Wshadow -Wformat=2 -Wfloat-equal -Wconversion -Wlogical-op
-Wcast-qual -Wcast-align -D_GLIBCXX_DEBUG -D_GLIBCXX_DEBUG_PEDANTIC -fsanitize=address -fsanitize=undefined
-fstack-protector
```

### 1.3 Complexity

Value	Complexity	Algorithms
$n < 10^{18}$	$O(1)$ , $O(\text{polylog}(N))$	Binary search, Functions (math)
$n < 10^9$	$O(\sqrt{n})$	Prime check, factorization
$n < 10^6$	$O(N)$ , $O(N \log(N))$	Greedy, Sorting, Binary search + Greedy, Divide and conquer, 1D Dynamic programming
$n < 10^3$	$O(N^2)$ , $O(N^2 \log(N))$	2D Dynamic programming, All-pair shortest path
$n < 100$	$O(N^3)$	Max-flow, Various unoptimized traversals
$n < 20$	$O(2^N)$	Combinations
$n < 16$	$O(N \cdot 2^N)$ , $O(N^2 \cdot 2^N)$	Bitmask dynamic programming
$n < 10$	$O(N!)$	Permutations

### 1.4 Common errors

- Loop bounds (especially with DP)
- Array bounds (make slightly bigger)
- Initialization (init and reset)
- Incorrect output format
- Wrong nesting
- Precision (use epsilon)
- Overflow (use 64-bit when in doubt)
- Invalid expressions (divide by zero, segfault)
- Index offset

- Rounding (floor, ceil or normal)
- Read complete input
- Boundary cases
- Wrong variable, copying mistakes, etc

## 2 STL

### 2.1 I/O

```
1 std::ios::sync_with_stdio(false); //speedup IO (dont combine with printf/scanf)
2 std::cin.ignore(n); //ignore n characters before continue
3 std::getline(std::cin, s); //reads whole line into string
4 std::cin >> std::noskipws; //dont skip whitespace
5 std::cout << std::fixed; //use fixed-point notation
6 std::cout << std::setprecision(n); //set the precision to n decimals
7 std::cout << std::setw(n); //set the length each output will contain
8 std::cout << std::setfill(c); //set the char to fill the remaining chars from above
```

### 2.2 String

```
1 //read a line
2 std::string s;
3 std::getline(std::cin, s);
4 //string split
5 std::vector<std::string> split(const std::string &s, char delim) {
6     std::vector<std::string> elems;
7     std::stringstream ss(s);
8     std::string item;
9     while (std::getline(ss, item, delim)) {
10         elems.push_back(item);
11     }
12     return elems;
13 }
14 //substring
15 str.substr(pos, LENGTH); //till end if LENGTH is empty
16 //string find
17 str.find("substring") //return std::string::npos if not found, else position first letter
```

### 2.3 Containers

```
1 std::vector<int> vec;
2 //sort from small to large
3 bool cmp(int a, int b){
4     return a < b;
5 }
6 std::sort(vec.begin(), vec.end(), cmp);
7 std::sort(vec.begin(), vec.end(), std::less<int>());
8 //use std::greater<int>() for large to small and std::less<int>() for small to large
9 std::find(vec.begin(), vec.end(), NEEDLE); //use .find() if available (map/set)
10 std::count(vec.begin(), vec.end(), NEEDLE); //use .find() if available (map/set)
11 //find union/intersection/difference -- both need to be SORTED already
12 std::vector<int> tmp(vec.size()+vec2.size());
13 std::set_intersection(vec.begin(), vec.end(), vec2.begin(), vec2.end(), tmp.begin());
14 std::set_union(vec.begin(), vec.end(), vec2.begin(), vec2.end(), tmp.begin());
15 std::set_difference(vec.begin(), vec.end(), vec2.begin(), vec2.end(), tmp.begin());
16 //filter unique elements
17 auto last = std::unique(vec.begin(), vec.end());
18 vec.erase(last, v.end());
```

### 2.4 String streams

```
1 //c-style for complex parsing
2 int in;
3 sscanf(str.c_str(), "%d", &in)
```

```
4 //convert number to string -- itoa()
5 std::ostringstream os;
6 os << (int) i;
7 os.str();
8 //convert string to number(s) -- atoi() or atol()
9 std::istringstream is(str);
10 is >> i;
```

## 2.5 Constants

```
1 INT_MIN
2 INT_MAX
3 LLONG_MIN
4 LLONG_MAX
5 PI //defined in header
6 EPS //defined in header
```

## 2.6 Math

```
1 ceil(a); //round up
2 floor(a); //round down
3 round(a); //round nearest
4 atan2(a, b); //atan with two parameters
5 frac_part = modf(d, intpart); //split up in parts (int_part is a double!)
6 std::__gcd(a, b); //greatest common divisor a, b
```

## 2.7 Permutations

$O(N!)$

```
1 std::vector arr;
2 std::sort(arr.begin(), arr.end());
3 do {
4     //work with permutation
5 } while (next_permutation(arr.begin(), arr.end()));
```

## 2.8 Binary search

$O(\log(N))$

```
1 std::multimap<int, int> m;
2 m.lower_bound(i); //first element equal or higher then i
3 m.higher_bound(i); //first element higher then i
4 std::pair<auto iter, auto iter> p = m.equal_range(i); //get all with equal value
```

## 2.9 Bit twiddling hacks

```
1 in |= (1 << a); //enable bit at position a
2 in ^= (1 << a); //toggle bit at position a
3 if(in & (1 << a)); //check bit at position a
4 //get last bit set (least signifcant)
5 c = (b & -b)
6 //ll for the long long versions
7 __builtin_popcount(in); //count the amount of bits set
8 __builtin_ffs(in); //give the least signifcant index + 1 in binary representation
9 __builtin_clz(in); //returns the number of leading zeros
10 __builtin_ctz; //give number of trailing zeros
```

### 3 Datastructures

#### 3.1 BIT

$O(\log(N))$

```

1 //use a std::map to save very large tables or for simple 2D (faster below)
2 int lst[MAXN];
3
4 int sum(int b){
5     int sum = 0; b+=1;
6     for(; b; b-=(b&(-b))){
7         sum += lst[b];
8     }
9     return sum;
10 }
11
12 int update(int b, int v){
13     b+=1;
14     for(; b<MAXN; b+=(b&(-b))){
15         lst[b] += v;
16     }
17 }

```

#### 3.2 2D-BIT

$O(N \log(N))$

```

1 //online  $O(N (\log(N))^2)$  is also possible using std::map<int, int>
2 std::pair<int, int> rs[MAXN]; //list of points (y,x)
3 std::vector<int> lst2[MAXN];
4 std::vector<int> order[MAXN];
5
6 int sum(int b, int c){
7     int sum = 0; b+=1; c+=1;
8     for(; b; b-=(b&(-b))){
9         int h = upper_bound(order[b].begin(), order[b].end(), c) - order[b].begin();
10        for(int d = h; d; d-=(d&(-d))){
11            sum += lst2[b][d];
12        }
13    }
14    return sum;
15 }
16
17 void update(int b, int c, int v){
18     b+=1; c+=1;
19     int unt = 0;
20     for(; b<MAXN; b+=(b&(-b))){
21         int h = upper_bound(order[b].begin(), order[b].end(), c) - order[b].begin();
22         for(int d = h; d<lst2[b].size(); d+=(d&(-d))){
23             lst2[b][d] += v;
24         }
25     }
26 }
27
28 void init(){
29     std::sort(rs, rs+MAXN);
30     for(int i=0; i<MAXN; ++i){
31         for(int j=rs[i].second+1; j<MAXN; j+=(j&(-j))){
32             order[j].push_back(rs[i].first+1);
33             lst2[j].push_back(0);
34         }
35     }
36     for(int i=0; i<MAXN; ++i) lst2[i].push_back(0);

```

37 | }

### 3.3 Segment tree

```

1 // inclusion segment tree (a node includes both it endpoints!)
2 struct Node{
3     Node(): li(0), ri(0), l(0), r(0) {}
4     int li;
5     int ri;
6     Node *l;
7     Node *r;
8
9     int val;
10
11     bool hupd;
12     int upd;
13 };
14
15 Node *r;
16
17 Node *build(int li, int ri) {
18     Node *n = new Node;
19     n->li = li;
20     n->ri = ri;
21     n->upd = 0;
22     if(li == ri){
23         n->val = 0; //init
24     }else{
25         int mi = (li+ri)/2;
26         n->r = build(li, mi);
27         n->l = build(mi+1, ri);
28
29         n->val = std::min(n->r->val, n->l->val); // merge
30     }
31     return n;
32 }
33
34 void pushd(Node *n){
35     if(!n->hupd) return;
36     n->l->val = n->upd; //update
37     n->r->val = n->upd; //update
38     n->l->upd = n->upd; //split (move old updates)
39     n->r->upd = n->upd; //split (move old updates)
40     n->l->hupd = true;
41     n->r->hupd = true;
42     n->hupd = false;
43     n->upd = 0;
44 }
45
46 int query(Node *n, int li, int ri){
47     if(ri < n->li || n->ri < li){
48         //outside
49         return INT_MAX;
50     }else if(li <= n->li && n->ri <= ri){
51         //inside
52         return n->val;
53     }
54     pushd(n);
55
56     int la = query(n->l, li, ri);

```

```

57     int ra = query(n->r, li, ri);
58     return std::min(la, ra); // merge
59 }
60
61 void update(Node *n, int li, int ri, int v){
62     if(ri < n->li || n->ri < li){
63         //outside
64         return;
65     }else if(li <= n->li && n->ri <= ri){
66         //inside
67         if(n->ri != n->li){
68             pushd(n);
69             n->upd = v; //split
70             n->hupd = true;
71         }
72         n->val = v; //update
73         return;
74     }
75     pushd(n);
76
77     update(n->l, li, ri, v);
78     update(n->r, li, ri, v);
79     n->val = std::min(n->r->val, n->l->val); // merge
80 }

```

### 3.4 Union-Find

 $O(\alpha)$ 

```

1  int pr[MAXN];
2  int sz[MAXN];
3
4  int find(int k){
5      if(pr[k] == k) return k;
6      else return pr[k] = find(pr[k]);
7  }
8  void merge(int a, int b){
9      a = find(a); b = find(b);
10     if(a == b) return;
11     if(sz[a] > sz[b]) std::swap(a, b);
12
13     pr[a] = b;
14     sz[b] += sz[a];
15     sz[a] = 0;
16 }

```

## 4 Math

### 4.1 GCD/LCM

 $O(\log(K))$ 

```

1  int gcd(int a, int b){
2      if(b == 0) return a;
3      return gcd(b, a%b);
4  }
5
6  int lcm(int a, int b){
7      return a*b/gcd(a,b);
8  }

```

## 4.2 Extended Euclidean

 $O(\log(K))$ 

```

1 //determines a and b satisfying s*a+t*b == gcd(a, b)
2 std::pair<int, int> extgcd(int a, int b){
3     int s = 0, old_s = 1;
4     int t = 1, old_t = 0;
5     int r = b, old_r = a;
6     while(r){
7         int q = old_r/r;
8         int sv;
9         sv = r;
10        r = old_r - q*r; old_r = sv;
11        sv = s;
12        s = old_s - q*s; old_s = sv;
13        sv = t;
14        t = old_t - q*t; old_t = sv;
15    }
16    return std::make_pair(old_s, old_t);
17    //return s, t if you want with result = zero
18 }
```

## 4.3 Multiplicative inverse

 $O(\log(K))$ 

```

1 //needs extended euclidean
2 int mod_inverse(int a, int m){
3     if(gcd(a, m) != 1) return -1; //inverse does not exist
4     int inv = extgcd(a, m).first;
5     if(inv < 0) {
6         int mlt = inv/m;
7         if(inv % m) mlt--;
8         inv -= mlt*m;
9     }
10    return inv;
11 }
```

## 4.4 Modular exponentiation

 $O(\log(K))$ 

```

1 //trick also works with matrices
2 long long expmod(long long a, long long b, long long m){
3     long long res = 1;
4     a = a%m;
5     while(b > 0){
6         if((b%2) == 1) res = (res*a)%m;
7         b >>= 1;
8         a = (a*a) % m;
9     }
10    return res;
11 }
```

## 4.5 Fibonacci

 $O(N)$ 

```

1 int fib(int n){
2     int a = 0, b = 1;
3     for(int i=0; i<n; ++i){
4         int t = b;
5         b = a+b;
6         a = t;
7     }
8 }
```

```

8     return a;
9 }

```

#### 4.6 Combinations

 $O(N^2)$ 

```

1 int cmb[MAXN] [MAXN];
2 int comb(int i, int j){
3     if(i < 0) return 0;
4     else if(j == 0) return 1;
5     else if(cmb[i][j] != -1) return cmb[i][j];
6     else return cmb[i][j] = comb(i-1,j-1)+comb(i-1,j);
7 }

```

#### 4.7 Gaussian elimination

 $O(N^3)$ 

```

1 int N; //amount of rows (columns = rows + 1)
2 double aug[MAXN] [MAXN];
3 double ans[MAXN];
4 void gaussian_elimination() {
5     // the forward elimination phase
6     for (int i = 0; i < N - 1; i++) {
7         int l = i;
8
9         // which row has largest column value
10        for (int j = i + 1; j < N; j++) if (fabs(aug[j][i]) > fabs(aug[l][i])) l = j;
11        // swap this pivot row, reason: minimize floating point error
12        for (int k = i; k <= N; k++){
13            double t = aug[i][k];
14            aug[i][k] = aug[l][k];
15            aug[l][k] = t;
16        }
17        // the actual forward elimination phase
18        for (int j = i + 1; j < N; j++)
19            for (int k = N; k >= i; k--) aug[j][k] -= aug[i][k] * aug[j][i] / aug[i][i];
20
21    }
22
23    // the back substitution phase
24    for (int j = N - 1; j >= 0; j--) {
25        double t = 0.0;
26        for (int k = j + 1; k < N; k++) t += aug[j][k] * ans[k];
27        ans[j] = (aug[j][N] - t) / aug[j][j];
28    }
29 }

```

#### 4.8 Prime generation

 $O(N \log(\log(N)))$ 

```

1 std::vector<long long> prms;
2 long long is_prm[MAXN];
3
4 //generate primes needed for functions below
5 void init_prms(){
6     for(long long i=0; i<MAXN; ++i) is_prm[i] = true;
7     for(long long i=2; i<MAXN; ++i){
8         if(!is_prm[i]) continue;
9         prms.push_back(i);
10        for(long long j=2*i; j<MAXN; j+=i) is_prm[j] = false;
11    }

```

12 } }

#### 4.9 Is prime

$O(\sqrt{N})$

```

1 bool is_prime(long long n){
2     for(size_t i=0; i<prms.size(); ++i){
3         if(prms[i]*prms[i] > n) return true;
4         if((n % prms[i]) == 0) return false;
5     }
6     return true;
7 }
```

#### 4.10 Factorize

$O(N \log(\log(N)))$

```

1 //returns list of factors and how many times they occur
2 std::vector<std::pair<int, int> > factors(long long n){
3     std::vector<std::pair<int, int> > v;
4     for(size_t i=0; i<prms.size(); ++i){
5         long long k = 0;
